

Top 10 Software Testing / QA Interview Questions & Answers

Candidate: Jayaprakash R

Based on the provided resume.

1. Tell me about yourself

Answer: My name is Jayaprakash. I completed my BCA from MGR Arts and Science College, Hosur. I have knowledge of Manual Testing and Automation Testing. I worked on an E-commerce website project with test cases, Selenium WebDriver, Java, TestNG, Cucumber BDD and JIRA. I also have basic knowledge of SQL and API testing. I am a quick learner and I am looking for an opportunity to start my career in Software Testing and develop my skills.

2. Explain your E-commerce project

Answer: My project was an E-commerce website. The main modules were user registration, product search, add to cart, payment and order confirmation. I analysed the business requirements and functional specifications, prepared and executed test cases, and automated test scenarios using Selenium WebDriver, Cucumber BDD and TestNG. I identified and tracked defects using JIRA and collaborated with developers to resolve them. The project followed Agile methodology.

3. What was your role in the project?

Answer: My role was mainly in software testing. I analysed requirements, prepared and executed test cases, performed automation testing using Selenium, identified defects and reported them in JIRA. I also participated in Agile activities such as sprint planning, daily stand-ups and sprint retrospectives.

4. Explain your Selenium framework

Answer: My resume says I used Selenium WebDriver, Cucumber BDD and TestNG, but it does not describe a specific framework architecture. A safe answer is: In my project, I used Selenium WebDriver with Java for web automation. I used TestNG to execute and organise test cases and Cucumber BDD to write scenarios in a readable format. Maven was used for dependency and project management. I would not claim a framework architecture that I have not personally implemented.

5. How do you write test cases?

Answer: First, I understand the requirement and identify the functionality to be tested. Then I prepare test scenarios and write test cases with preconditions, test steps, test data, expected results and actual results. After execution, I mark the test case as Pass or Fail. If it fails, I report the defect with proper evidence.

6. Explain Severity vs Priority

Answer: Severity tells us how much impact a defect has on the application. Priority tells us how quickly the defect needs to be fixed. For example, if payment is completely broken, it can be high severity and high priority. A spelling mistake may have low severity, but the business may still consider it high priority depending on where it appears.

7. Explain Defect Life Cycle and JIRA

Answer: A defect can move through New, Assigned, Open, Fixed, Retest, Verified and Closed. If it still exists during retesting, it can be Reopened. In JIRA, I would report the summary, description, steps to reproduce, expected result, actual result, severity, priority and screenshots. After the fix, I retest and update the status.

8. Explain Selenium waits and XPath

Answer: Implicit wait tells Selenium to wait for a specified time when searching for elements. Explicit wait waits for a specific condition, such as an element becoming visible or clickable. XPath is used to locate elements.

Example: `//input[@id='username']`.

9. Explain TestNG and Cucumber BDD

Answer: TestNG is a Java testing framework used to organise and execute test cases, with features such as annotations, grouping, prioritisation and reporting. Cucumber is a BDD framework where scenarios are written using Gherkin keywords such as Given, When and Then. Example: Given the user is on the login page; When the user enters valid credentials; Then the user should be logged in successfully.

10. How would you test an E-commerce website?

Answer: First, I would understand the requirements and identify the major modules. I would test registration, login, product search, product details, add to cart, cart updates, checkout, address, payment, order confirmation, order history and logout. I would perform functional, negative and regression testing. For selected repetitive scenarios, I would use Selenium automation. Defects would be reported in JIRA with proper details and evidence.
